

Software Engineer — Practical Assessment

IT & Digital Transformation | Final Round

Time to complete: 3–4 hours	Submission window: 2–3 days from receipt
------------------------------------	---

The Task

A wholesale trading company wants a simple dashboard to track salesperson sales performance against budget.

Build a small web application that does the following:

- Allows a user to upload one Excel file containing: Salesperson, Month, Budget Amount, Actual Sales
- Displays a summary table showing Budget, Actual, Achievement %, and whether each salesperson is above or below target
- Shows one chart — budget vs actual per salesperson

Create your own sample data for testing. The app does not need a database — keeping data in memory or session is fine. You are free to choose any stack, framework, or architecture you prefer.

What to Submit

- The working application — GitHub link, live link, or zip file
- 3–4 sentences covering: your approach, your stack choice, and what you would build next with more time
- A 10-minute walkthrough of the application — Loom recording, or live in the next round

Use of AI Tools

Using AI coding tools (Claude Code, Cursor, Copilot, ChatGPT, or equivalent) is expected and encouraged.

We are interested in **how you use them** — how you broke down the problem, what you prompted, and what you reviewed or changed. You remain responsible for understanding and explaining every part of the solution.

Be ready to explain any part of your code during the walkthrough.
